

## Geometry Terms

You must learn these off by heart, and in some cases, be able to give examples.

TERM	DEFINITION
<b>Axiom</b>	A statement that we accept without any proof
<b>Theorem</b>	A rule that has been proved by following a certain number of logical steps or by using a previous theorem or axiom you already know
<b>Proof</b>	A series of logical steps that we use to prove a theorem
<b>Corollary</b>	A statement that follows readily from a previous theorem
<b>Converse</b>	<p>The reverse of a theorem</p> <p>Eg.</p> <p><b><u>Statement:</u></b> <i>The interior angles of a square each measure <math>90^\circ</math> (TRUE)</i></p> <p><b><u>Converse:</u></b> <i>If the interior angles each measure <math>90^\circ</math>, then the figure is a square (FALSE)</i></p>
<b>Implies</b>	<p>Used in a proof when a statement follows on from previous proved statements</p> <p><b><u>Symbol:</u></b> <math>\Rightarrow</math></p>

TERM	DEFINITION		
<b>Is equivalent to</b>	Two things are equivalent if they have the same value but different forms eg. $\frac{2}{3} = \frac{4}{6}$ or $\$2 = \text{€}1.50$		
<b>If and only if</b>	<p>Eg. If and only if means that X will only be true when Y is true and Y will only be true when X is true.</p> <p>An example would be "The light will come on if and only if the switch is in the on position"</p> <p><math>\Leftrightarrow</math> Can be shortened to iff</p>		
<b>Proof by contradiction</b>	<p>A proof where an assumption is made. Then, by using valid arguments, a statement is arrived at which is clearly false, so the original assumption must have been false.</p> <p>We prove that a statement or assumption is true by showing that the statement or assumption being false would imply a contradiction (impossibility).</p>		
<p><b><u>Prove that <math>\sqrt{2}</math> is irrational</u></b></p> <p>Assume the contrary: <math>\sqrt{2}</math> is rational</p> <p>there exists integers p and q with no common factors such that:</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50%; vertical-align: top;"> <math display="block">\frac{p}{q} = \sqrt{2} \quad (\text{Square both sides})</math> <math display="block">\Rightarrow \frac{p^2}{q^2} = 2</math> <math display="block">\Rightarrow p^2 = 2q^2</math> <math display="block">\Rightarrow p^2 \text{ is even } (\text{.....it's a multiple of } 2)</math> <math display="block">\Rightarrow p \text{ is even } (\text{.....even}^2 = \text{even})</math> <math display="block">\therefore p = 2k \text{ for some } k</math> </td> <td style="width: 50%; vertical-align: top;"> <math display="block">p^2 = 4k^2 \quad (\text{Square both sides})</math> <math display="block">p^2 = 2q^2 \text{ and } p^2 = 4k^2</math> <math display="block">\Rightarrow 4k^2 = 2q^2 \quad (\text{Divide both sides by } 2)</math> <math display="block">\Rightarrow 2k^2 = q^2</math> <p>Then similarly <math>q = 2m</math> for some <math>m</math></p> <math display="block">\Rightarrow \frac{p}{q} = \frac{2k}{2m} \Rightarrow \frac{p}{q} \text{ has a factor of } 2 \text{ in common.}</math> <p>This contradicts the original assumption.</p> <p style="text-align: center;"><b><u><math>\sqrt{2}</math> is irrational</u></b>      <b>Q.E.D.</b></p> </td> </tr> </table>		$\frac{p}{q} = \sqrt{2} \quad (\text{Square both sides})$ $\Rightarrow \frac{p^2}{q^2} = 2$ $\Rightarrow p^2 = 2q^2$ $\Rightarrow p^2 \text{ is even } (\text{.....it's a multiple of } 2)$ $\Rightarrow p \text{ is even } (\text{.....even}^2 = \text{even})$ $\therefore p = 2k \text{ for some } k$	$p^2 = 4k^2 \quad (\text{Square both sides})$ $p^2 = 2q^2 \text{ and } p^2 = 4k^2$ $\Rightarrow 4k^2 = 2q^2 \quad (\text{Divide both sides by } 2)$ $\Rightarrow 2k^2 = q^2$ <p>Then similarly <math>q = 2m</math> for some <math>m</math></p> $\Rightarrow \frac{p}{q} = \frac{2k}{2m} \Rightarrow \frac{p}{q} \text{ has a factor of } 2 \text{ in common.}$ <p>This contradicts the original assumption.</p> <p style="text-align: center;"><b><u><math>\sqrt{2}</math> is irrational</u></b>      <b>Q.E.D.</b></p>
$\frac{p}{q} = \sqrt{2} \quad (\text{Square both sides})$ $\Rightarrow \frac{p^2}{q^2} = 2$ $\Rightarrow p^2 = 2q^2$ $\Rightarrow p^2 \text{ is even } (\text{.....it's a multiple of } 2)$ $\Rightarrow p \text{ is even } (\text{.....even}^2 = \text{even})$ $\therefore p = 2k \text{ for some } k$	$p^2 = 4k^2 \quad (\text{Square both sides})$ $p^2 = 2q^2 \text{ and } p^2 = 4k^2$ $\Rightarrow 4k^2 = 2q^2 \quad (\text{Divide both sides by } 2)$ $\Rightarrow 2k^2 = q^2$ <p>Then similarly <math>q = 2m</math> for some <math>m</math></p> $\Rightarrow \frac{p}{q} = \frac{2k}{2m} \Rightarrow \frac{p}{q} \text{ has a factor of } 2 \text{ in common.}$ <p>This contradicts the original assumption.</p> <p style="text-align: center;"><b><u><math>\sqrt{2}</math> is irrational</u></b>      <b>Q.E.D.</b></p>		

## Theorem 20: Proof by Contradiction

(i) Each tangent is perpendicular to the radius that goes to the point of contact.

Suppose the point of contact is  $P$  and the tangent  $t$  is *not* on the perpendicular to  $OP$

Let the perpendicular to the tangent from  $O$  meet it at  $Q$ .

Pick  $R$  on  $PQ$ , on the other side of  $Q$  from  $P$ , with  $|QR| = |PQ|$

Then triangle  $OQR$  is congruent to triangle  $OQP$

$|OR| = |OP|$ , so  $R$  is a second point where  $t$  meets the circle.

This contradicts the given fact that  $t$  is a tangent.

Thus  $t$  must be a perpendicular to  $OP$ , as required.

Example:

Triangle  $ABC$  has no more than one right angle.

Can you complete a proof by contradiction for this statement?

1. Assume  $\angle A$  and  $\angle B$  are right angles
2. We know  $\angle A + \angle B + \angle C = 180^\circ$
3. By substitution  $90^\circ + 90^\circ + \angle C = 180^\circ$
4.  $\therefore \angle C = 0^\circ$  which is a contradiction
5.  $\therefore \angle A$  and  $\angle B$  cannot both be right angles
6.  $\Rightarrow$  A triangle can have at most one right angle
